Description

The CL2 product family are temperature compensated unipolar current regulator with an enable pin available in 5mA to 30mA versions. It is designed to be used under a wide range of voltages, from 6V to 250V DC. The CL2 is primarily intended as a current limiting LED driver for serial LED applications in industrial lamp indicators, signage, accent and automotive lightning. Other applications include constant current source and sink. The CL2 temperature coefficient is optimized from -40C to 125C. The CL2 will source or sink constant current. The CL2 will likely require a heat sink connected to the Source (pin 2).

Concept of Operation

This chip is powered by applying a voltage difference between Sink and Source terminal. As the Enable voltage rises, the N-Channel MOSFET begins to conduct current between Sink and Source terminals. The temperature compensated source resistor senses this current and provides this feedback voltage to the non-inverting input of the operational amplifier. The operational amplifier compares the feedback voltage with the reference voltage provided by a p-n junction. The operational amplifier drives the gate of the N-channel MOSFET such that the feedback voltage and the reference voltage remain equal.

p-n functions exhibit a negative temperature coefficient of approximately -2mV/^{o}C. The Source resistor is temperature compensated to match the temperature coefficient of the p-n junction. In this way, the regulated current flowing between Sink and Source will be (to a first order) independent of the chip junction temperature.

The power dissipated by the chip is given simply as I_{lim} * (V_{Sink} - V_{Source}). The chip will likely require a heat sink mechanically connected to the Source terminal (pin 2).

Terminal Definition

Terminal Name	Pin No.	Type	Description
Sink	1	HV Input	Sinks the load current.
Source	2	VH Input	Usually Ground. Sources the load current.
